PEKIFLOW / WORKFLOW GUIDE

Turn cleaning enquiries into a booking link

A practical n8n template using Gmail, Gemini, Google Sheets and Cal.com. Set it up with your own accounts, then test it before enabling automatic processing.

What the workflow does

Reads incoming customer emails, extracts cleaning details with Gemini, prepares a reply, asks the owner to approve it, and sends a Cal.com booking link. The enquiry and reply are recorded in Google Sheets.

1. Customer email arrives
2. Sender checks and duplicate check
3. Gemini extracts the enquiry details
4. Owner approves the draft
5. Customer receives a Cal.com link
6. Customer books on Cal.com

What it does not do

It does not generate leads, take payment, quote a cleaning price, or handle phone calls, WhatsApp or Instagram. It sends a link for a 30-minute video estimate consultation. Cal.com bookings are not synced back into Sheets in this version.

SETUP / 01

Connect your accounts

1. Import the workflow

In n8n, create a workflow and use Import from File to select **cleaning-enquiry-workflow.json**. It is inactive and contains no credentials. The template is based on n8n 2.33.5; node screens may differ in other versions.

2. Prepare Google Sheets

Create one spreadsheet. Import **Messages.csv** and **Threads.csv** as separate tabs named **Messages** and **Threads**. Preserve the headers. The spreadsheet ID is the part between /d/ and /edit in its URL.

3. Fill Business Settings

Replace **REPLACE_OWNER_EMAIL** with the approval recipient; **REPLACE_BUSINESS_EMAIL** with the Gmail inbox connected to the trigger; **REPLACE_SHEET_ID** with your spreadsheet ID; and **REPLACE_CAL_COM_BOOKING_URL** with your full public https://cal.com/ booking link. Keep demo_mode set to false; this template runs real integrations.

4. Select credentials

Connect Gmail in Incoming Customer Email, Fetch Full Customer Email, Owner Approves and Send Approved Customer Reply. Connect Google Sheets in Lookup Message ID, Lookup Thread, Reserve Message ID and Save Thread State. Connect your Gemini API credential in Google Gemini Chat Model and choose a model available to your account. Check provider quotas and pricing; free usage is not guaranteed.

5. Prepare Cal.com

Create a 30-minute Cleaning Estimate event in your own account. Connect its calendar, review availability and timezone, and open the public link to verify slots. Cal.com handles booking and confirmation; the n8n workflow does not create a second calendar event.

TEST / 02

Try one enquiry first

1. Send a fresh test email

From a different email account, send to your connected business inbox. Subject: **TEST-DAY5-NEW-01**. Body: *Hi, I am Alex. I need a move-out cleaning estimate in Raleigh. Can I book a consultation?* Use a new subject for each new enquiry test.

2. Run and approve

Choose Incoming Customer Email and execute the workflow. If necessary, fetch a fresh test event in that trigger first. Check that the approval email reaches your owner inbox. Click Approve. On localhost, open the approval link on the computer running n8n.

3. Check the result

The customer should receive your Cal.com booking link. Check the Threads tab for **booking_link_sent** and Messages for the processed message. Open the link and complete a clearly labelled test booking with your own test details. Verify confirmation in Cal.com and your connected calendar; cancel the test booking afterward.

4. Enable automatic processing

After the manual test succeeds, publish the workflow. While n8n is running, the Gmail trigger checks every minute. The template filter only accepts TEST-DAY5 subjects. Change it to your intended enquiry filter before using it for genuine customers. Test one enquiry at a time.

If something fails

No email found: check the subject filter, inbox and connected account. No approval: check the owner email and execution status. Duplicate ignored: send a genuinely new message. Gemini error: check the model, quota and credential. Sheets error: check the ID, tab names and headers. Booking page has no slots: check Cal.com availability and calendar conflicts.

Verification: The original email and calendar workflow was tested with real integrations. This shareable Cal.com version has passed code and placeholder checks, and the source booking page displayed available slots. The full recipient-configured Cal.com flow must be tested after setup. Sheets saves thread state before Gmail sends; check both systems after a failed run. Sheets deduplication is not an atomic lock for concurrent runs.
