

FROM MANUAL WORKFLOWS TO AUTONOMOUS DIGITAL ENGINES

Business Automation Guide

— See it. Read it. Reason. Act — at scale —

Full-Stack Engineering

Next.js · React · TypeScript · FastAPI · PostgreSQL

Autonomous AI Workflows

LLM orchestration · RAG pipelines · MCP systems

Robotic Process Automation

Playwright headless bots at computational speed

Transparent Pricing

Published rates. Free working prototype before any payment commitment.

Engineering-First Culture

The founder writes production code personally on every client project.

Deterministic AI

Strictly typed scaffolding enforced around every probabilistic LLM call.

8+

Platforms

Omni-channel autonomous publishing engine

100%

Custom-Built

No templates. Every pixel engineered from scratch.

₹8,999

SECTION 01

The Automation Paradigm Shift

Most businesses view automation through the narrow lens of basic tools like Zapier or Make.com. While useful for simple tasks, these tools fail when workflows become complex, when platforms lack official APIs, or when cognitive decision-making is required mid-process. At Logic Intelligence Technologies, we engineer Autonomous Engines. By combining Python, Playwright headless browser automation, and LLM orchestration, we build software that can see, read, reason, and act exactly like a human employee — only at infinite speed and without error. Visit logicintelligencetechnologies.in to see live examples.

THE THREE PILLARS OF LIT AUTOMATION

Pillar 1: Data Ingestion*The Eyes*

Python web scrapers and API listeners gather data automatically. When a legacy platform lacks an API, Playwright bots log in via a virtual browser, navigate the UI, and scrape the exact HTML elements needed —

using CSS selectors with deterministic precision. No data source is off-limits.

Pillar 2: Cognitive Parsing*The Brain*

Raw data is useless without context. We pipe ingested data into highly-constrained LLM prompts with strict JSON schema enforcement. The AI reads unstructured data — an angry customer email, a complex vendor invoice —

and extracts the exact variables our software needs to execute on next.

Pillar 3: Autonomous Execution*The Hands*

Once data is parsed and the decision is made, scripts execute the outcome: updating a PostgreSQL database, triggering a Next.js frontend update, sending a personalised email via SendGrid, or

having the Playwright bot navigate back into a portal to click Approve and auto-fill a response form.

SECTION 02

Real-World Scenarios & ROI Analysis

Scenario A

The Omni-Channel Auto-Publisher

A marketing manager currently spends 3 hours daily logging into 5 different platforms to post content. Our script takes a single markdown file and autonomously logs into LinkedIn, X (Twitter), Instagram, Telegram, and WordPress via headless browser. It formats text perfectly for each platform's character limits and algorithms, attaches the correct media dimensions, and clicks publish — all without human intervention. One markdown file triggers 8 platforms.

ROI METRICS:

- 15 hours saved per week
- Zero login fatigue
- 8 platforms, 1 trigger
- Formatted per platform algorithm

Scenario B

Omni-Apply: Autonomous Application Bot

The LIT bot reads a user's master resume. It navigates to application portals via Playwright. When it encounters a unique question such as 'Why do you want to work here?', it reads the DOM context, sends it to an LLM API with the job description, generates a hyper-personalised 150-word answer, auto-fills the text box, and submits. This process runs across 100 portals simultaneously, 24 hours a day. Zero human input after initial configuration.

ROI METRICS:

- 10,000% outbound scale
- Hyper-personalised LLM answers
- Parallel multi-portal execution
- Zero daily human effort

SECTION 03

The Implementation Lifecycle

01

Workflow Audit & Documentation

We shadow your team, recording exact mouse clicks, keystrokes, and decisions during the manual process. We identify every conditional branch, every exception handler, and every system touchpoint. This audit produces the definitive automation specification document before a single script is written.

02

Script Architecture & Edge-Case Design

We build the Python logic, define CSS selectors for browser automation, and write deterministic AI prompts with strict JSON schema enforcement. We architect for edge cases first — what happens when the website changes its layout? What if a page times out or a CAPTCHA appears unexpectedly?

03

Sandbox Testing with Failure Injection

The bot runs in a safe test environment against a cloned dataset. We deliberately introduce failure scenarios: network timeouts, CAPTCHA triggers, form validation errors. Each exception produces a specific error handler and retry logic with exponential backoff, not a system crash.

04

Production Deployment & Monitoring

The script is deployed to a cloud server (AWS or Vercel) and scheduled via cron jobs at specific intervals — every midnight, every 15 minutes, or instantly triggered by a webhook event. Monitoring alerts and Slack notifications are configured for any execution failures or anomalies.

START YOUR AUTOMATION AUDIT TODAY

Every manual workflow that runs on a schedule is a candidate for automation.
